

Which outcome to the Article 50 process do the British people want?

Prepared for YouGov by Benjamin Lauderdale with contributions from Jack Blumenau, Doug Rivers and Anthony Wells. 7 December 2018.

OVERVIEW

This document reports on a national and parliamentary constituency-level analysis of the British public's preferences regarding the resolution of the current Article 50 withdrawal process from the European Union. The estimates provided here are based on the same modelling techniques that we used in the YouGov 2017 UK General Election Model, which correctly predicted the hung parliament and 93% of individual seats. This approach allows us to not just calculate national support for different possible outcomes of the Brexit process, but to use demographic, geographic and political patterns in support for different parties across the UK to assess views in each parliamentary constituency. This report was prepared in advance of the planned 11 December 2018 House of Commons vote on the deal negotiated and agreed by the UK government with the European Commission.

GENERAL FINDINGS

1. **It is not clear what respecting the result of the referendum or the will of the British people requires.** Given a choice between remaining in the EU and leaving under the terms of the proposed deal, UK likely voters are evenly divided. Both the proposed deal and remaining in the EU are preferred to leaving without a deal among all UK likely voters. Among the voters who voted Leave in the 2016 referendum, a majority would prefer to leave without a deal.
2. **Few people have changed their minds since the 2016 referendum.** The vast majority of Leave voters prefer either leaving under the terms of the proposed deal or on the basis of no deal, with more supporting no deal. The vast majority of Remain voters still prefer to Remain, with nearly all of the rest supporting the deal.
3. **MPs face difficult choices about who they represent and how to represent them when they vote.** If MPs look to the views of their constituents rather than those of the UK as a whole, there are a substantial number of MPs in both the Conservative and Labour parties who would find reason to vote against their party whip. A majority would find reason to support the proposed withdrawal agreement overall. However, if MPs look specifically towards the views of the people who voted for them within their constituencies in the 2017 election, very few will find reason to defy the party whip.

METHODS

Data Collection

YouGov collected data for this project from 27 November to 6 December. A sample of 51833 respondents was collected covering Great Britain. This analysis unfortunately excludes Northern Ireland, which has about 3% of the UK voting age population because the different structure of census data from Northern Ireland prevented us from including this area at short notice. This does mean that, given the results of the 2016 referendum in Northern Ireland versus the rest of the UK, we may slightly underestimate support for remaining in the EU for the UK as a whole by only analysing GB. The resulting errors cannot be very large because Northern Ireland's population is very small relative to the rest of the UK.

Survey Question

We polled a single question regarding three possible resolutions of the Article 50 process.

The UK is currently scheduled to leave the EU on 29 March 2019. UK and EU negotiators recently completed an agreement on the terms of the UK's exit from the EU, but this proposed deal has yet to be confirmed by the UK House of Commons.

From most preferred to least preferred, how would you rank the following three options?

No Deal: leave the EU without a withdrawal agreement.

Proposed Deal: leave the EU under the terms of the negotiated agreement.

Remain: stop the exit process and remain in the EU.

Respondents could then drag each of the three options into the order that they preferred, or could specify that they did not know. Partial orderings (consisting of only a top choice) were not permitted. The three response options were provided in a random initial order, and had to be actively dragged into place for the respondent to be able to complete the question (unless the "Don't Know" checkbox was selected).

While further options could have been provided for ranking, these three options are the three that are most clearly within the power of the UK to realise. Other options would require the EU to make a new agreement at odds with the previous public statements of EU leaders.

Individual Preference Orderings and Public Choice

There are six possible preference orderings that a respondent can give to our survey question. Where the symbol “>” means “is preferred to” or “is ranked above”, we can write these:

1. Remain > Deal > No Deal
2. Remain > No Deal > Deal
3. Deal > Remain > No Deal
4. Deal > No Deal > Remain
5. No Deal > Deal > Remain
6. No Deal > Remain > Deal

Our data analysis is based on the relative frequency that people give these six possible answers. From these, we can assess the core question that we are interested in, which is: “which outcome to the Article 50 process do the British people want?”

A naive way to aggregate individual preferences into a public choice over the three options would be to simply calculate the **plurality winner** among first preferences: Remain supporters are those giving rankings 1 and 2 above, Deal supporters are those giving 3 and 4, No Deal supporters are those giving 5 and 6. While this is how the UK elects MPs from multiparty constituencies, it is a bad way to aggregate public preferences into a sense of what “the public wants” because it is a very sensitive to the number of choices given. In particular, in this case, there are two options which involve leaving the EU and they do in fact split support among those who want to leave the EU.

A better way to make a decision between more than two alternatives is an instant runoff or **alternative vote** (AV) system. In such a system, first preferences are counted up initially, and the three alternatives are ranked. Then, the least popular option is taken out of consideration, and the individuals who ranked that choice first are reallocated according to their second preference. This ensures that, of the last two options remaining, a majority of voters prefer the one that is chosen as the winner to the one that is not chosen as the winner. This sort of system would be likely to be the system chosen for a three-way referendum vote because it is symmetric between the three alternatives. While versions of this system are used by the Labour and Conservative parties for their leadership elections, the British public rejected alternative vote as a system for the election of MPs in the 2011 AV referendum.

While alternative vote is guaranteed to select a winner among the three options, it does not always select options that would beat all others in pairwise comparisons. This is because an option that could defeat both of the others in pairwise competitions might be eliminated in the first round when it faced both at the same time. An option which defeats both others in pairwise competition is called a **Condorcet winner**. A Condorcet winner is not guaranteed to exist, which means that this cannot be used as the standard for decision-making when a decision is required. It is possible to have a situation where option A defeats option B, option B defeats option C, and option C defeats option A, each when the first preferences for the excluded option are reallocated by second preference.

The fact that there is not an obviously correct way to determine a three-way choice by voting is related to Arrow's impossibility theorem. We will make reference to plurality, alternative vote and Condorcet winners at various points below because they are three different ways to talk, albeit imperfectly, about what outcomes of the Article 50 process are more or less consistent with public preferences.

Model

There are not enough observations in individual constituencies to treat the data as separate constituency polls, but we can look for patterns in responses across constituencies that have similar characteristics, and then work out the implications of those patterns for each constituency. This strategy of "multilevel regression and post-stratification" or *MRP* is the same approach we used in the 2017 YouGov election model that correctly predicted the hung parliament and 93% of individual constituency winners.

Our modelling approach proceeds in two steps. First, we build a detailed description of which kinds of people live where in the UK. This *population model* tells us how many people we think voted in different ways in recent elections, are of each age, gender, level of educational qualifications, etc, and all the combinations of these, in each UK parliamentary constituency. The population model is constructed from a number of sources, including past election results, a variety of types of survey data and UK census data.

Second, we use the YouGov survey data described above to build a *survey response model* for individual's relative preferences regarding the possible Brexit outcomes. This is a model of how these six possible preference orderings are associated with the individual level characteristics that are in our description of the population plus characteristics of parliamentary constituencies. The survey data might indicate that people with different educational qualifications are giving different patterns of responses, or that different parts of the UK are giving different responses, or other similar patterns. The model describes all of these patterns, and allows us to make predictions about how individuals with any combination of characteristics would respond to the survey question.

Once we have these two things, we can systematically go through all the types of people that our population model says exist and use the survey response model to predict preferences for individuals of each type. For example, our population model tells us that there are some number of women who are 31-35 year-old, with a university degree, who voted Remain in 2016 and Labour in 2017, and who live in the Kensington constituency in London. Our survey response model then gives us a prediction of their survey responses on the question described above. We can then tally up these predictions for all the individuals that our population model says exist in the UK population, which gives us an estimate for the UK as a whole. Alternatively, we can tally up those predictions for each constituency separately, yielding estimates for every constituency, or by any other characteristic that we have used in the population model (age, gender, qualifications, etc). The survey response model captures the demographic patterns in how people are responding, and then this "post-stratification" step works out

the implications given the variable demographic composition of different places (or groups) in the UK.

The models we have developed for this project look for patterns as a function of a number of variables, including individual 2017 vote, referendum vote, sex, age, qualifications, housing tenure, marital status and ethnicity. At the level of constituencies, we look for patterns as a function of the electoral history of the constituency, EU referendum vote, region/country, and several other variables.

Target Population

Our model targets the population of likely general election voters rather than the UK population as a whole. We do not rely on respondents' self-reported likelihood of voting to determine likely voters, but instead we build a model based on data from past elections to predict whether different types of individual would be likely to vote in a new election. The result of this process is that we assume that the electorate for a new election would be demographically similar to the electorates of 2015 and 2017. This is the same strategy we used for the 2017 election model. This strategy is not perfect (it is possible that there will be changes to the demographic make-up of the electorate if a new election or referendum were held) but is also unlikely to yield large errors.

GB RESULTS

Preference Orderings

Table 1: Estimated percentages of voters with each possible preference ordering:

Remain > Deal > No Deal	35.5
Remain > No Deal > Deal	9.8
Deal > Remain > No Deal	6.1
Deal > No Deal > Remain	19.9
No Deal > Deal > Remain	24.9
No Deal > Remain > Deal	3.8

Table 1 reports the percentages of likely voters that we estimate hold each possible preference ordering over Remain, the Deal and No Deal. The most popular single preference ordering is Remain as the first preference, the Deal as second preference and No Deal as third preference, a view held by 35.5% of voters. There is a strong tendency for those with Remain as their first preference to put the Deal (35.5%) rather than No Deal (9.8%) as their second preference.

The next two most popular preference orderings are the two which place Remain last, with either No Deal (24.9%) or Deal (19.9%) as first preference. Those who put No Deal first, are far more likely to put the Deal second (24.9%) than Remain second (3.8%). Those who put the Deal first, are more likely to put the No Deal second (19.9%) than Remain second (6.1%).

First Preferences

Table 2: Estimated distribution of voters' first preferences:

Remain	45.3
Deal	26.0
No Deal	28.7

When we aggregate the preference orderings according to first preferences, we get the results shown in Table 2. Remain receives the highest level of first preference support (45.3%), but less than 50% of all voters. Levels of support for the Deal (26%) and for No Deal (28.7%) are similar.

Pairwise and Condorcet Winners

In order to determine if there is a Condorcet winner among the three alternatives, we need to determine which options are preferred in each of the possible pairwise comparisons. For example, to compare Remain to the Deal, we need to reallocate everyone with a No Deal first preference to their second preference. We then do the same for each of the other comparisons. The results of this are shown in Table 3.

Table 3: Estimated results of pairwise comparisons between the three options:

Comparison	Result
Deal vs No Deal	61.5 - 38.5
Remain vs No Deal	51.4 - 48.6
Remain vs Deal	49.1 - 50.9

Deal easily defeats No Deal, with over 60% of voters preferring the former to the latter. Remain also defeats No Deal, albeit more narrowly. The comparison between Remain and the Deal is extremely close, so close that we cannot be confident as to which is actually preferred by more voters. Given the sampling uncertainty associated with the data we have collected, the share supporting Remain in this hypothetical could be anywhere from 47.9 to 50.4% (95% interval estimate).

Alternative Vote Winner

If alternative vote was used to determine a winner, the fact that the first preferences for the Deal and for No Deal are so similar means that either could plausibly be eliminated after the tallying of first preferences. Since Remain would probably defeat No Deal, but is much closer versus a Deal, this means that the Alternative Vote winner is more likely to be Remain than is the Condorcet winner. So long as the Deal is ahead of No Deal in first preferences, the Condorcet winner will be the same as the Alternative Vote winner, because they will both be the winner of the pairwise comparison of the Deal with Remain, reallocating those whose first preference is No Deal. However, our current best estimate is that the Deal would be eliminated in the first round of an AV instant runoff, and so the winner of such an exercise would be most likely to be Remain.

DEMOGRAPHIC RESULTS

The tables in this section report on the modeled distributions of voter preference orderings and first preferences, tabulated by 2016 referendum vote, 2017 general election vote, age, qualifications, sex and attention to politics. The final column in each table indicates the percentage of likely voters that we would expect to be in this group in a referendum or election.

Preferences by 2016 Referendum and 2017 General Election Vote

The next three tables show the current estimated preferences of likely voters given how they voted in the 2016 referendum (Table 4), how they voted in the 2017 general election (Table 5) and combinations of those involving the Labour and Conservative parties (Table 6). No Deal is the majority preference of those who voted Leave in 2016. We find the proportion of 2016 Remain voters who now support one of the two options that involve leaving the EU is somewhat higher than the proportion moving in the other direction, but generally few people have “switched sides”.

Those who have changed their views are primarily those whose referendum vote in 2016 and general election vote in 2017 were in tension: Remain supporting Conservative voters and Leave supporting Labour voters. In the 2017 election, we saw that a lot of the switching between Labour and the Conservatives was 2015 Labour 2016 Leave voters moving the Conservatives while 2015 Conservative 2016 Remain voters moved to Labour. We see a similar process here: 2016 Leave 2017 Labour voters moving to Remain while 2016 Remain 2017 Conservative voters moving to supporting a leave option (primarily the deal). So just as Brexit appears to have encouraged some people to switch their votes between 2015 and 2017 to bring their party choice into greater alignment with their views of Brexit, it appears that other people have switched their views on Brexit since the referendum to bring them into alignment with most of the rest of their party’s supporters. The consequence of this is that the association between party preference and Brexit preferences are now substantially stronger than they were at the time of the referendum two years ago.

Preferences by Age, Qualifications, Gender and Attention to Politics

The relationships between other variables and preferences on resolving the Article 50 withdrawal process mostly reflect the associations between those variables and support for Brexit, which previous studies have examined in more detail than we will here. What is new here are the associations between these demographic variables and support for the deal relative to no deal, among those who prefer an EU exit of some kind. Older people, those with higher qualifications, those who are female, and those who pay less attention to politics, are all somewhat more likely to support the deal rather than no deal.

Table 7: Estimated preference orderings by age (columns 1-6), first preferences (columns 7-9) and percentage of voters (column 10).

	R>D>ND	R>ND>D	D>R>ND	D>ND>R	ND>D>R	ND>R>D	Remain	Deal	No Deal	%

CONSTITUENCY RESULTS

We are able to use our model to assess public opinion at the level of parliamentary constituencies as well as at the national level.

First Preference, Alternative Vote & Condorcet Winners

Table 11: Estimated preferred outcome in each parliamentary constituency under plurality voting, under alternative vote, and by the criterion of Condorcet winner:

	Remain	Deal	No Deal	None
Plurality	549	0	83	0
Alternative Vote	288	33	311	0
Condorcet	242	390	0	0

Because of “vote splitting” between Deal and No Deal, Remain is the plurality winner in the vast majority of constituencies. As we have already noted, this is why simply looking to first preferences is an inadequate way of assessing preferences regarding these three options.

Under Alternative Vote, all three options win a significant share of parliamentary constituencies, even though No Deal is not the Condorcet winner in any UK constituency. The reason for this is that there is no constituency in which No Deal defeats the Deal after allocating the second preferences of voters with a first preference for Remain. The constituencies where No Deal wins under AV are all constituencies where the Deal is eliminated in the initial ranking of first preferences, and then No Deal defeats Remain after allocating the second preferences with a first preference for the Deal. As becomes clear in the Demographic tables in a later section, 2016 Leave supporters split close to evenly between supporting the Deal and No Deal. When combined with the fact that nearly everyone supporting Remain as a first preference has the Deal as their second preference, makes it difficult for No Deal to defeat the Deal in a pairwise comparison in any constituency. There do not seem to be very concentrated pockets of support for No Deal relative to the Deal, either geographically or demographically.

MP Party and Constituent Preferences

Table 12: Alternative vote winner within each parliamentary constituency by MP party:

	Deal	No Deal	Remain
Con	31	209	77
Green	0	0	1
Lab	1	102	159
LD	1	0	11
Other	0	0	1
PC	0	0	4
SNP	0	0	35

Table 13: Condorcet winner within each parliamentary constituency by MP party:

	Deal	Remain
Con	264	53
Green	0	1
Lab	125	137
LD	1	11
Other	0	1
PC	0	4
SNP	0	35

Tables 12 and 13 show the alternative vote and Condorcet winners within each parliamentary constituency by MP party. While there is a clear tendency for Conservative MPs to have constituencies where the Deal or No Deal wins under AV and the Deal by Condorcet, there are 53 Conservative MPs who represent constituencies where Remain is the Condorcet winner. Similarly, there are 125 Labour MPs who represent constituencies where the Deal is the Condorcet winner.

MPs might take a narrower view of who they represent and therefore focus on the views of the people who voted for them in their constituency. If we calculate the Condorcet winners in each seat among only those who voted for the MP in 2017, we get a very different picture (Table 14). Every Conservative MP was voted into office by a set of voters among whom the Condorcet winner is the Deal, although there are a substantial number of Conservative MPs where the plurality winner is No Deal and it is the second preferences of those Conservative voters who prefer Remain that yield the Deal as the Condorcet winner (Table 15). Every Labour MP was voted into office by a set of voters among whom the Condorcet winner is Remain.

We note here that this result is heavily driven by the fact that 2016 referendum and 2017 general election votes strongly predict current preferences regarding the Article 50 process, and we find only a moderate degree of within-party and within-referendum vote variation across different groups of individuals and regions of the country. It is possible that there are in fact a few more places where MPs own supporters are out of line with the views of party supporters across the UK, but there are clearly very few.
